How is AutoCAD Suitable for My Needs? AutoCAD is best for users who are also familiar with the application. Because AutoCAD is so similar to the drawing tools they are used to, people with no experience in CAD may find it difficult to grasp. AutoCAD is best for people who are familiar with the tooling. The application is made to be used on a drawing board, so users need to be comfortable operating a mouse and keyboard, and drawing and editing with the mouse and on the screen. AutoCAD is best for those who are comfortable working alone. The application is made for solo users who are used to working alone. Although AutoCAD can function as a collaborative app, it is optimized for those who do not need others' input or feedback. AutoCAD also can be used without any people present. AutoCAD is best for those who can explain the details of the tool and its processes. Because AutoCAD is a commercial CAD application that is used to design the internal and external features of buildings, structures, and other products, users must understand the underlying technical processes of how AutoCAD works. AutoCAD is best for those who can explore the entire software interface, understand how the tools work, and who feel they can use the tools to produce high-quality drawings and prints. AutoCAD was designed to be used by "amateurs" and "professional" CAD users who are not necessarily experts in CAD. Stroke is a major cause of death and disability worldwide. Previous studies have demonstrated that sleep disturbances are common in stroke patients. However, whether sleep disturbances are independently associated with mortality or neurological outcome after stroke is unknown. The aim of this study was to evaluate the association between sleep disturbance and mortality and neurological outcome after acute stroke. This is a retrospective cohort study of 481 consecutive patients admitted within 24 hours after acute ischaemic stroke or transient ischaemic attack (TIA) to 16 university hospitals in six European countries. A structured interview

for sleep disturbance was performed and information on clinical variables, stroke severity, functional disability and vascular risk factors were collected from hospital records. Mortality and functional outcome at discharge were prospectively registered. Sleep disturbance was found in 50% of the patients. After a mean follow-up of 31 months, 148 patients had died. Multivariate analysis revealed that age, stroke severity, baseline Barthel index and sleep disturbance were independently associated with mortality. Sleep disturbance was also independently associated with functional disability at discharge. Furthermore, a negative association was found between sleep a1d647c40b
